For the entire semester, Greg and Taylor split the work very evenly. With the addition of cody to our group in mid October, we definitely lost some steam. He was active for about 10 total days and tried to derail our project by only using the code that he brought to the group that he didn't even understand. Once we lost contact with him, Taylor and Greg were able to get back on track a bit. Each assignment including the lexer, simple parser, complete parser, and symbol table included a combination of independent and collaborative work where we both tried to independently solve problems and then got together to combine our code and decide what methods to use. The code generation assignments were almost entirely done collaboratively in the library where we worked together to have the correct output. Overall we both (Taylor and Greg, not cody) contributed equally to the project in ways that fit our strengths.
